

COURSE SYNOPSIS

BACHELOR OF AGRICULTURE SCIENCE (HONS.)

CODE BPKP	PROGRAMMES OFFERED
HG34	Crop Production
HG35	Horticulture and Landscaping
HG36	Livestock Production

COURSE SYNOPSIS

RT10402 INTRODUCTION TO AGRICULTURE

The course introduces students to the importance of agriculture to mankind, history and development of agriculture, current issues and challenges in agriculture ranging from environment, food security and needs, food safety, to biotechnology and genetically modified organisms. Shifts in Malaysian agriculture policies, objectives and strategies over several decades since independence will be highlighted. Sustainable agriculture and management practices which are widely accepted and adopted by farmers and nations around the world will be introduced. Prospects and opportunities in the agriculture sector will also be discussed

RT10303 AGRICULTURAL CHEMISTRY

This is an introductory course specifically on topics needed for an understanding of the basic chemistry of agriculture. Topics covered will include basic atomic, physical and organic chemistry, mole concept, solutions, states of matter, acids-bases and salts, chemical reactions, water and air chemistry, surface and colloidal chemistry, and agrochemicals (fertilizers and pesticides). Students will be made aware of the use of isotopes and nuclear techniques in agriculture.

RT10503 AGRICULTURAL ECOLOGY

This course will introduce students to the basics and principles of ecology implemented in agriculture systems. The important elements in agricultural ecology include interactions between weather, soils, energy, water, plants and biological populations. Application of the concepts and knowledge in agricultural ecology enables students to practice sustainable agriculture. i.

RT10203 GENETICS

This course introduces the basic principles of inheritance in plant and animal organisms. Discussion encompasses the concepts of gene and chromosome, mitosis and meiosis, Mendelian laws of inheritance, factors that contribute to modification of Mendelian patterns, molecular genetics (DNA structure, replication, gene expression and gene mutation) and population genetics. The role of genetics in agriculture will be shown in related topics.

RT10403 SOIL SCIENCE

This is a fundamental soil science course which introduces students to the basic physical, chemical, biological and morphological properties of soils and functions in relation to agriculture. Emphasis will be placed in the context of tropical conditions with particular reference to Malaysian soils. Soils will be perceived as a product of various processes acting over time on parent materials. The wide variety of soils resulting from the soil-forming processes and their classification using the standard USDA and local (Malaysian) soil classification systems will be highlighted. The importance of appropriate management and land use practices to ensure conservation and sustainability for agriculture will be discussed..

RT20101 FIELDWORK

This is an on and off campus practical training course to familiarise students with basic tools, skills and knowledge in crop and livestock farming, and landscaping, nursery and field planting techniques will be introduced. Cultural practices such as nursery bed preparation, planting, potting, preparation of soil or planting medium, weeding, fertilizing, watering, pruning, thinning, and composting as well as the handling and care of livestock in pen houses, free range and paddocks will be done.

RT20303 AGRICULTURAL BIOTECHNOLOGY

This course will introduce students to the application of recombinant DNA technology to agriculture. Methods of introducing foreign DNA into plant and animal cells and generation of stable transformed plants and animals will be studied. Students consider specific examples of the use of transgenic plants and animals which are resistant to pathogens and tolerant to specific herbicides. Since recombinant agricultural products are released into the environment or consumed as foods, students will be familiarised with environmental safety issues.

RT20102 ORGANIC FARMING

This is an introductory course to the principles of soil fertility, crop and livestock management by organic methods in contrast to conventional chemical methods of farming. Students will gain an understanding of the role of organic agriculture in society in relation to environmental, social and economic sustainability. This course will cover topics such as meeting crop nutrition needs using organic materials, on-farm compost production, the use of cover crops, organic methods of weed, pest and disease control, organic livestock production, organic certification, and the marketing of organic farm products

RT20203 AGRICULTURAL MICROBIOLOGY

This course offers the basic knowledge on microbes and their roles in ecosystems. The early parts of the lecture are related to morphology and structures, microbial diversity and growth. Microbial genetics and the manipulation of microbial plasmid in genetic engineering for enhancement of crop and animal production are discussed. Their functions related to the soil fertility and crops productivity is discussed. Roles of microbes in biogeochemical cycles, environments, food production and bioremediation are discussed.

RT20402 INDUSTRY REVOLUTION AND BIOMETRY

This course will introduce and expose the student to the concept and fundamental pillars of IR4.0 in particular the knowledge digitization and machine learning. The student will also be introduced to statistical analysis and its application in agriculture. The course will show how statistics are being used to evaluate the results of agricultural research. The course will cover both descriptive statistics, which summarize the data obtained in research, and inferential statistics, which are used to decide whether the results of research confirm the researcher's hypotheses. Specific topics to be covered include sampling and estimation, hypothesis testing, t-tests, analysis of variance, correlation, regression analysis, and non-parametric methods of statistical analysis.

RT20603 INTRODUCTION TO AGRICULTURAL ENGINEERING

Students will learn a wide range of fundamental engineering concepts, principles and applications in agriculture (from land preparation to post-harvest) with a strong emphasis on problem solving. Aspects of mechanics, hydraulics, electric and electronics will be covered. The principles and applications of internal combustion engines, electric motors and pumps will be discussed

RT30402 RESEARCH PROJECT 1

This course concerns with the theoretical aspects of the scientific approach of carrying out a scientific research project. It covers literature review, project proposal preparation and presentation, and writing of a scientific report.

RT30301 AGRO- ENTREPRENEURSHIP PRACTICE 1

This is a farm practical course dealing with the field practices in crop production, horticulture and livestock production. Students will have the opportunity to get hands on experience of the day to day activities and real problems and challenges that are encountered in the farm and field conditions. Student will work in groups to plan and execute an agro-enterprise until marketing.

References

RT30302 EXPERIMENTAL DESIGN AND ANALYSIS

Students will learn concepts, principles and methods/steps in setting up an agricultural experiment. Students will also learn statistical analysis based on the experimental design used. The experimental designs included are Completely Randomized, Randomized Complete Block, Latin Square and Split Plot Designs as well as factorial experiments. Suitable ways and methods of analyzing data for these experimental designs will also be taught.

RT30103 AGRICULTURAL EXTENSION

This course teaches students on the concepts, philosophy and methodology of agricultural extension. They would also be exposed to the scope of agricultural extension. They would also undertake practical extension training/fieldwork in a number of communities and report their personal experiences during those training.

RT30202 SCIENTIFIC WRITING AND COMMUNICATION

This course provides students the opportunity to acquire the necessary knowledge and skills in scientific writing and communication, such as, writing a research proposal, a dissertation, or a journal article in accordance with the specified format.

RT30401 AGRO-ENTREPRENEURSHIP PRACTICE 2

This is a farm practical course dealing with the field practices in crop production, horticulture and livestock production. Students will have the opportunity to get hands on experience of the day to day activities and real problems and challenges that are encountered in the farm and field conditions. Student will work in groups to plan and execute an agro-enterprise until marketing.

RT40012 INDUSTRIAL TRAINING

Industrial Training is to experience and understand real life situations in industrial organizations and their related environments and accelerating the learning process of how student's knowledge could be used in a realistic way. In addition to that, industrial training also makes one understand the formal and informal relationships in an industrial organization so as to promote favourable human relations and teamwork. Besides, it provides the exposure to practice and apply the acquired knowledge hands-on in the working environment. Moreover, students can gain hands-on experience that is related to the students majoring so that the student can relate to and widen the skills that have been learnt while being in university. Furthermore, students implement what they have learned and learn more throughout this training. During industrial training students can learn the accepted safety practices in the industry. Students can also develop a sense of responsibility towards society.

RT40103 PRECISION FARMING

This course introduces students to the concepts, technologies and applications involved in precision agriculture. This entails the theory and use of some high-technology equipment for assessing field conditions and applying inputs such as seeds, fertilizers and chemicals for weed, pest & disease management. Students will also be exposed to precision technologies in livestock production such as in feeding, reproduction and health management. The course will also cover parameter measurements with ICT through various sampling and mapping procedures for soil nutrients and crop yield using geo-statistics, spatial patterns, GNSS, DGPS, GIS, remote sensing and aerial photography. The use of enabling hardware and software in precision farming applications will be some of the hands-on experience in which students will participate.

RT40204 RESEARCH PROJECT 2

This course concerns with the practical aspects of scientific research. It involves execution of the research plans that have been developed and evaluated in Research Project 1 (RT30102). The students will undertake an independent lab and/or field work on the approved thesis topic in consultation with his/her supervisor/adviser. The results will be subsequently analysed, discussed and combined with the previous report (RT30102), and finally presented as a dissertation of 12,000 – 15,000 words.

RT40303 AGRICULTURAL ECONOMICS AND AGRIBUSINESS

This course discusses the basic agricultural economic principles to assist the students to make decision how to choose the combination of inputs and outputs that will generate the most profit to their businesses. This course also will teach the students how to manage an agribusiness, and explain how to start-up, run and manage their own agribusiness specifically in financial management. Additionally, the students will be taught and guided to prepare a business plan. It also includes chapters on the basic

principles of agriculture marketing, investment analysis, and economic activity and analysis.

RT40402 ISSUES AND CURRENT DEVELOPMENTS IN AGRICULTURE

This is a seminar course on current global, regional or local issues and development in agriculture which will be presented by policy makers, representatives of Government implementing agencies, industries, financial institutions as well as from experts, renowned researchers and academics.

CROP PRODUCTION PROGRAMME (HG34)

RC10102 PLANT NUTRITION

An introductory course concerning a fundamental understanding of soil fertility, plant nutrition and soil nutrient management. This will include the roles and functions of nutrients to plants, deficiency & toxicity symptoms, nutrient availability and uptake by plants from the environment (aerial, soil and soil-less). Types of chemical/inorganic and organic fertilizers, an appreciation of the importance of good fertilizer management in various soils and plant production systems and how soil pH influences nutrient uptake will be discussed. Students will learn how to calculate fertilizer application amounts for any given crop based on fertilizer recommendation rates.

RH10203 PLANT PHYSIOLOGY

Plant physiology is an examination of plant function ranging in complexity from individual cells up to the whole plant. As relatively immobile organisms, plants must adapt to the prevailing environment and consequently have unique mechanisms to deal with non-ideal growing conditions. Both normal growth and development as well as how the plant responds and adapts to adverse conditions are major themes in plant physiology research. This course will focus on the major physiological processes occurring in plants grown under ideal conditions as well touch on the physiology of stress- adaptation.

RH20103 PLANT BREEDING

This course emphasizes the basic principles and concepts of genetic improvement of agricultural crops through application of basic qualitative and quantitative genetic principles. Different plant breeding methodologies relative to the mode of reproduction of plants will be discussed. Application of tools such as mutation, wide hybridization, tissue culture, genetic engineering and molecular markers, in the breeding of plants will also be discussed.

RC20203 WEED SCIENCE

This course is a study of weeds and their control. Principles including weed plant classification, weed biology and ecology, and plant and herbicide chemistry will be taught. Practices which prevent, control and eliminate weeds will be discussed. Herbicide formulations and safe herbicide use will be taught.

References

RH20303 PLANT PROPOGATION AND NURSERY MANAGEMENT

This course stresses on the principles and techniques of propagation of agricultural plants, using seeds (sexual) and vegetative (asexual) plant parts. Students will also be introduced to in vitro micro-propagation for mass plant propagation, including media composition and preparation. General nursery practices and maintenance are highlighted.

References

RC20403 CROP PEST MANAGEMENT

This course will emphasize various techniques for management of all classes of crop pests. The techniques of pest management involve cultural control, physical, chemical, genetics, host-plant resistance, insect resistance, and others. An application of integrated approaches using least destructive, economically and environmental friendly methods, and protection of non-target organisms will also be taught. Toxicology and classification of pesticides, chemical residue risks to land and aquatic environments, international quarantine system and local rules and regulations of quarantine system for controlling the spread of plant pests and diseases will also be taught. Identification and symptoms of injury of major species of pests such as insects, mammalia, gastropoda and others, which damage major agriculture crops and control measures will be introduced in

this course.

RC20803 PASTURE AND FODDER PRODUCTION

This course introduces the production of forages including grasses, leguminous and non-leguminous plants and fodder as ruminant feed. Commonly sown forages and legumes in the country will be introduced while the establishment, growth, harvest, maintenance, renovation and succession will be described during lecture and practical session. The establishment of forages under cut-and-carry fodder system and pasture grazing system, as well as integration will be discussed. The relationship between pasture and fodder production with animal production system will be detailed. Exposure to the quality of forages as affected by various factors will be given. The conservation of excess forages or the maintaining of the quality of forages will also be included. Finally, the methods and analyses in determining the quality of forages will also be a part of this course.

RH30103 FARM MECHANIZATION

This course introduces the principles, design and operation of common types of farm machinery and mechanisms; familiarizes students with agricultural mechanization policy and strategy and its implications on agricultural development; teaches students financial costing and accounting of agricultural machinery, and analyses factors that affect economic operation for effective management decisions.

RC30303 SEED TECHNOLOGY

Seed development after fertilisation, seed structures and dispersal are taught. The physiology of seed germination, viability tests and seedling vigour are highlighted. Categories of seeds for human consumption, livestock feeds and as planting materials, seed production, collection, cleaning, processing, and storage (of orthodox and recalcitrant seeds) and cryo- preservation are included. Seed testing laboratories and protocol for seed purity and standards set by A.O.S.A. are included. Controlled pollination in the production of breeder seeds is also taught. Seed certification for commercial seed producers and the network in seed trade are integral parts of the course.

RC30402 CEREAL CROPS

This course will cover the management practices and infrastructure requirements related to the cultivation of major cereal crops such as rice, maize, sorghum and others. Post-harvest handling, storage and processing of products will be mentioned. Utilisation of crop products for human consumption, snack food industries and industrial applications are taught.

RC30503 PLANTATION CROPS

This course will cover the management of plantation crops such as rubber, cocoa, coconut, sugarcane, coffee, tea, pepper and others. Discussion includes basic planting practices, crop management and processing of produce. An understanding of the botanical characteristics, ecology, propagation and nursery techniques, land management, estate infrastructure and maintenance will be emphasized.

RC30602 ROOT CROPS

This course emphasizes the classification, ecology and methods of propagation and planting of root crops such as tapioca, sweet potatoes, potatoes, taro, yams and others. The management, harvesting, and processing of tubers into starch are discussed. Utilisation of tubers and starch for food, confectionery, snacks and industrial applications are highlighted.

RC30703 PLANT PATHOLOGY

This course introduces to students the fundamental concepts of plant pathology. At the early week of semester the modes of action of abiotic and biotic agents to cause diseases to plants are discussed. Genetics, physiological and biochemical aspects of pathogens and host plant interactions are discussed. At the later stage of this course, non-chemical and chemical controls of plant diseases are discussed.

RC30802 OIL PALM MANAGEMENT

In this course students will be taught about the oil palm industry in Malaysia, the botany of the plant and the characteristics of different clones. Nursery management, land clearing, field operations, infrastructure development and planting techniques will be discussed. Aspects of hand pollination to produce Tenera clonal seeds (Durax Pisifera crosses) and production of pre-germinated seeds are taught. Harvesting of fresh fruit bunches (FFB), bunch analysis, oil extraction and utilisation of Crude Palm Oil (CPO), Crude Palm Kernel Oil (CPKO) and by-products in related industries are highlighted.

RC40202 FOOD PROCESSING AND PRESERVATION

This course concerns the principles and methods of processing and preservation used in the food industry. Technologies involving heating, chilling, freezing, dehydration, salt, sugar, acids, chemical preservatives, ionizing radiations and novel methods; processing methods such as refrigeration, evaporation, fermentation, extrusion, chemical and physical separation, and particle size reduction will be taught.

RH40302 POST-HARVEST TECHNOLOGY

The course will highlight topics related to the causes, principles and practices that result in post-harvest losses and appropriate methods to reduce these losses. The biophysical and biochemical changes in agricultural produce and factors that influence the quality of produce during storage will be discussed.

ELECTIVE COURSE

RC30302 FARM IRRIGATION SYSTEMS

This course deals with the principles and practices of irrigation science and management for efficient use of water through various methods and systems of irrigation application. The course provides the skills necessary for the design and management of effective and efficient on-farm irrigation systems. The soil-plant –water-atmosphere relations, crop water requirements and the removal of surplus water from farm fields (drainage) will also be covered. Emphasis will be placed on automated systems and components.

RC30502 ADVANCED CROP SCIENCE

This is an advanced level course which draws on courses done earlier in your program at the plants community scale It requires evaluation, integration and application of principles of crop production to develop understanding of sustainable crop production systems. The application of physiology and agronomy in crop production and the influences of environment on crop growth, and biological and economic yield will be emphasized. The use of crop growth simulation models will be examined.

RC30702 SOIL FERTILITY MANAGEMENT

This course will cover the factors influencing soil fertility, the principles underlying sustainable soil fertility management for agricultural production and environmental guardianship, and the integrated perspectives related to water, nutrients, and organisms in soil. The processes influencing soil health and management applications are discussed from the perspective of major "problem" soil types in Malaysia. (Peat, acid sulphate, BRIS, coastal, sloping & highly weathered soils). Soil conservation methods with

particular reference to soil erosion will be covered. Interpretation of analytical data and practical recommendations relating the maintenance and improvement of soil fertility will be covered.

RC30902 AGRICULTURAL ENTOMOLOGY

This course will familiarize the students with skills and knowledge on agricultural entomology. Learning of insect life cycle, ecology, reproductive biology and morphological structure will provide training to students on characteristic of major agricultural crop pests in Malaysia. Classification and identification using taxonomic guide key enable students to identify insect up to the level of species. A basic learning of entomology will provide an essential tool of knowledge before a proper control and management of insect pest can be carried out. This course will also expose students to some selected agricultural plant insect pests such as coconut, oil palm, rice, vegetables, fruits and others. An appropriate trapping methods using light traps, baited traps etc. for surveillance and sampling of insect will also be introduced to students.

RC31002 SOILLESS CULTURE

This course will provide students with good background of the principles, practices, techniques, infrastructures and technologies of growing plants without soil. It covers species in several important systems such as water culture, sand culture, gravel culture, aeroponics, tube culture, nutriculture, etc. Management of soilless culture production system will also be discussed include use of organic, inorganic production and vertical farming.

RC31102 HERBS AND SPICES CROPS

This course emphasizes to the herb and spice crops in propagation, cultivation management in farm, harvest, postharvest handling and processing aspects. The estimate cost of production and income of the herb and spice crops along with their importance in agricultural sector in our country will be discussed.

RC31202 LEGUMES AND MISCELLANEOUS CROPS

The botany of grain legumes (groundnut, soybean, etc) and miscellaneous crops (kenaf, jatropha etc) are outlined. The importance of legumes in nitrogen fixation; the grain for food, and animal feed are emphasized. Discussions include planting practices and crop maintenance, harvesting and storage of the produce. Intercropping of legumes with other food crops and the use of legume plant residue for green manure are included. Utilization of legume grains and other products are stressed.

RC31302 MANAGEMENT OF SMALL AND MEDIUM ENTERPRISE

This course focuses on how entrepreneurs of small and medium size enterprises (SMEs) start-up, run and manage the competitive advantage of their business. The current SME development programmes by Malaysian government through its various ministries and agencies will also be introduced to the students. The current issues and challenges facing the SMEs in Malaysia also covered in this course.

RC31402 WATER RESOURCE MANAGEMENT

This course provides a broad overview on water resources, quantity, quality, uses and management in relation to agriculture. The hydrologic cycle, biophysical principles and the effects of changing climate / environment factors on water resources and sustainable practices in use of water resources for agriculture will be stressed. Current issues regarding water use in agriculture will be discussed.

RC31502 PLANT SYSTEMATICS

This course introduces students to conventional taxonomy, description, identification, nomenclature, and classification of plants. They will be guided to understand the reconstruction of phylogeny or evolutionary history of plant life. The course is divided into four parts: introduction to systematic, evolution and diversity of plants, systematic evidence and descriptive terminology, and resources in plant systematic. Emphasis is given on the application of systematic approach to identify and select plants, from the pool of genetically related agricultural and horticultural plants, or hybrids, for further trait and quality enhancement.

RC31602 INTRODUCTION TO AQUA-AGRI ENTREPRENEURSHIP

The course introduces students to the value chain of aqua-agri entrepreneurship. Topics taught entail importance of distinguishing the high impact projects in aqua-agriculture, stimulators for aqua-agri entrepreneurship development, critically linkages between various organization/stakeholders in the chain, profiling of aqua-agri business chains, selected market channels and inter-sectoral networks in the pipeline of entrepreneurship. Students will experience to use value chain analysis as a method to understand aqua-agri pipelines from a holistic view. This course will also expose students to identify opportunities in aqua-agri entrepreneurship.

RH30502 PLANT MOLECULAR BIOLOGY

This course will touch on the function and structure of the transposable elements and gene tagging, plant and organ development, genome chloroplasts, and lipid biosynthesis. It will also introduce the available and recent techniques used for isolation of proteins and nucleic acids, analysis of gene expression, DNA manipulation and transformation, and transfection and regeneration. These techniques are commonly applied in the agricultural and plant sciences, especially for crop improvement, genetic engineering, gene expression and its manipulation.

RH30802 PLANT TISSUE CULTURE

This course emphasizes on the theory, application, and techniques useful for propagating tissues in the research laboratory. Topics selected for study include sterile techniques, media preparation, establishment and maintenance of explant, callus and suspension cultures and growth measurement of cell, tissue, and organ culture.

RH30902 CONTROLLED ENVIRONMENT AGRICULTURE

In this course, students will learn about the principles, methods, and techniques related to the production of crops under protected/greenhouse conditions. The measurements and control of environmental factors affecting plant growth and development under controlled environment will be studied. Factors such as light intensity, light quality, temperatures, relative humidity, carbon dioxide, water, air current will be covered. Cultural practices for plant protection, nutrient and water delivery systems and control systems will be highlighted. Students will learn application of instrumentation in greenhouses and basic technical aspects of greenhouse design and construction. Hands-on experience will be a major aspect of this course.

RH31302 MUSHROOM TECHNOLOGY

This is an applied course. Students will initially be introduced to the introduction, history, scope of edible mushroom cultivation. Types of edible mushroom and certain mushroom species will be used as case study such as *Calocybe indica*, *Volvariella Volvacea*, *Pleurotus sp.*, *Agaricus bisporus*, *Shiitake*. Lab practicals involve preparation of pure culture, preparation of media (potato dextrose agar and oatmeal agar media), sterilization, and preparation of test tube slants to store mother culture.

HORTICULTURE AND LANDSCAPING PROGRAMME (HG35)

RC10102 PLANT NUTRITION

An introductory course concerning a fundamental understanding of soil fertility, plant nutrition and soil nutrient management. This will include the roles and functions of nutrients to plants, deficiency & toxicity symptoms, nutrient availability and uptake by plants from the environment (aerial, soil and soil-less). Types of chemical/inorganic and organic fertilizers, an appreciation of the importance of good fertilizer management in various soils and plant production systems and how soil pH influences nutrient up take will be discussed. Students will be able to calculate fertilizer application amounts for any given crop based on fertilizer recommendation rates.

RH10203 PLANT PHYSIOLOGY

Plant physiology is an examination of plant function ranging in complexity from individual cells up to the whole plant. As relatively immobile organisms, plants must adapt to the prevailing environment and consequently have unique mechanisms to deal with non-ideal growing conditions. Both normal growth and development as well as how the plant responds and adapts to adverse conditions are major themes in plant physiology research. This course will focus on the major physiological processes occurring in plants grown under ideal conditions as well as touch on the physiological adaptations under stress conditions.

RH20103 PLANT BREEDING

This course emphasizes the basic principles and concepts of genetic improvement of agricultural and horticultural plants through application of basic qualitative and quantitative genetic principles. Different plant breeding methodologies relative to the mode of reproduction of plants will be discussed. Application of modern tools such as tissue culture and genetic engineering, in the breeding of plants will also be discussed.

RC20203 WEED SCIENCE

This course is a study of weeds and their control. Principles including weed plant classification, weed biology and ecology, and plant and herbicide chemistry will be taught. Practices which prevent, control and eliminate weeds will be discussed. Herbicide formulations and safe herbicide use will be taught.

References

RH20303 PLANT PROPOGATION AND NURSERY MANAGEMENT

This course introduces the basic principles and techniques of plant propagations by sexual (seed) and asexual (vegetative) including plant tissue culture. In this course, the nursery management and maintenance aspects will be emphasized.

References

RC20403 CROP PEST MANAGEMENT

This course will emphasize various techniques for management of all classes of crop pests. The techniques of pest management involve cultural control, physical, chemical, genetics, host-plant resistance, insect resistance, and others. An application of integrated approaches using least destructive, economically and environmental friendly methods, and protection of non-target organisms will also be taught. Toxicology and classification of pesticides, chemical residue risks to land and aquatic environments, international quarantine system and local rules and regulations of quarantine system for controlling the spread of plant pests and diseases will also be taught. Identification and symptoms of injury of major species of pests such as

insects, mammalia, gastropoda and others, which damage major agriculture crops and control measures will be introduced in this course.

RH20603 TURF MANAGEMENT

This course provides and shares knowledge and skills on planting and maintenance of turfgrass. The lecture and practical will cover topics on importance of turfgrass and its associated industry, types of turfgrass in Malaysia, identification, selection, planting, primary maintenance, and secondary maintenance of turfgrass. This course will also cover turfgrass management for golf course, urban landscape and recreational areas.

RH30103 FARM MECHANIZATION

This course introduces the principles, design and operation of common types of farm machinery and mechanisms; familiarizes students with agricultural mechanization policy and strategy and its implications on agricultural development; teaches students financial costing and accounting of agricultural machinery, and analyses factors that affect economic operation for effective management decisions.

RH30302 OLERICULTURE

This course provides knowledge on principles and practices in the production and management of highland and lowland vegetable crops. It covers species in several important families such as leguminosae, solaceae. Cucurbitaceae, cruciferae, malvaceae and liliaceae. Management factors to be discussed include use of organic and inorganic fertilizers, pest and disease control, weed control and fertigation. The use of hydroponics and net-houses for vegetable production will also be discussed.

RH30503 LANDSCAPE HORTICULTURE

This course introduces the knowledge in landscape design which includes basic elements of landscape, spatial design and the application of sustainable landscape practices. It also explores sustainability issues, historical, psychological, cultur al and art in the natural and built environment.

References

RH30602 FLORICULTURE AND ORNAMENTALS

This course discusses identification, usage, propagation, and cultural requirements of flowering plants, trees, shrubs, vines, and ground covers used in Malaysian landscapes. It also includes the physiological principles and commercial practices involved in the production of potted and bedded plants, as well as greenhouse production systems.

References

RC30703 PLANT PATHOLOGY

This course introduces the concepts of plant pathology due to abiotic and biotic agents. Further discussion will include the attack mechanisms and disease symptoms by biotic agents such as viruses, bacteria, fungi, phytoplasmas and plant parasites, as well as plant reactions toward pathogens attack. Other areas of emphasis are plant-pathogen genetic interactions, plant disease epidemiology, non-chemical and chemical controls of plant diseases.

RH30803 LANDSCAPE DESIGN

This course provides students with an understanding and application of principles and elements of landscape design. Theory and practices of landscape design from around the world are introduced; with the focus on parks and sustainable design strategies.

RH31002 POMOLOGY

This course provides knowledge on aspects of fruit production from planting to harvesting with special emphasis on local fruits. Discussion will include collection and cultivation of potential indigenous fruit species for future propagation and breeding purposes.

References

RH40302 POST-HARVEST TECHNOLOGY

The course will highlight topics related to the causes, principles and practices that result in post-harvest losses and appropriate methods to reduce these losses. The biophysical and biochemical changes in agricultural produce and factors that influence the quality of produce during storage will be discussed.

References

RH40202 GARDEN PLANNING AND MANAGEMENT

The course exposes the students to the sustainable planning and management of a garden or a park. Students are challenged to produce a Management Plan based on practices and policies from around the world; as implemented by national parks and botanical gardens locally and globally.

ELECTIVE COURSE

RH30502 PLANT MOLECULAR BIOLOGY

This course will touch on the function and structure of the transposable elements and gene tagging, plant and organ development, genome chloroplasts, and lipid biosynthesis. It will also introduce the available and recent techniques used for isolation of proteins and nucleic acids, analysis of gene expression, DNA manipulation and transformation, and transfection and regeneration. These techniques are commonly applied in the agricultural and plant sciences, especially for crop improvement, genetic engineering, gene expression and its manipulation.

- Lewin, B. 2004. Gene VIII. Pearson Education International. Schuler, M. A. 2005. Methods in Plant Molecular Biology. Elsevier.

RH30702 FOOD BIOPROCESSING

This course provides an overview of relations between biotechnology, its role and importance in bioprocess of the processing industry. A perspective of bioprocess advances in food production and processing will be discussed to develop and broaden students' knowledge in technological aspects and some related issues.

RH30802 PLANT TISSUE CULTURE

This course emphasizes on the theory, application, and techniques useful for propagating tissues in the research laboratory. Topics selected for study include sterile techniques, media preparation, establishment and maintenance of explant, callus and suspension cultures and growth measurement of cell, tissue, and organ culture.

RH30902 CONTROLLED ENVIRONMENT AGRICULTURE

This course will discuss the principles and concepts of crop production in protected environments such as using plastic tunnels or hydroponics to grow high value crops. The growth environment (temperature, light, humidity, nutrient supply) are computer controlled and can be varied to produce a suitable growth environment for temperate, sub-tropical and tropical crop species. Crop management and system automation practised in protected environments will be discussed. Culture of selected high value fruits, vegetables and ornamentals will also be highlighted.

RH31102 LANDSCAPE CONSTRUCTION AND MANAGEMENT

This course emphasizes on the second stage of landscape improvement; from preconstruction activities to details of works associated with landscape construction. It features the opportunity for students to get hands-on training on small-scale landscape construction and management projects.

References

RC30302 FARM IRRIGATION SYSTEMS

This course deals with the principles and practices of irrigation science and management for efficient use of water through various methods and systems of irrigation application. The course provides the skills necessary for the design and management of effective and efficient on-farm irrigation systems. The soil-plant –water-atmosphere relations, crop water requirements and the removal of surplus water from farm fields (drainage) will also be covered. Emphasis will be placed on automated systems and components.

RC30702 SOIL FERTILITY MANAGEMENT

This course deals with cycling of nutrient elements, evaluation of soil fertility status and fertilizer requirements. Interpretation of analytical data and practical recommendations relating the maintenance and improvement of soil fertility will be covered. Management of soils in Malaysia (Peat, acid sulphate, BRIS, tin-tailing, coastal, sloping & highly weathered soils) will be emphasized. Soil conservation methods with particular reference to soil erosion will be covered.

RC30902 AGRICULTURAL ENTOMOLOGY

This course will familiarize the students with skills and knowledge on agricultural entomology. Knowledge about insect life cycle, ecology, reproductive biology and morphological structure will provide training to students on the characteristics of major agricultural plant pests in Malaysia. Classification and identification using systematic guide key enable students to identify insects up to the species level. A basic knowledge of entomology will provide an essential understanding for proper control and management of insect pests. This course will also expose students to common agricultural insect pests of rubber, coconut, oil palm, cocoa, coffee, corn, tobacco, sugar cane, vegetables, fruits, storage products, ornamental plants and others.

Press. Alford, D.V. 2007. Pests of fruit crops: a colour handbook. Manson Pub, London.

RC31002 SOILLESS CULTURE

The principles, practices, techniques, infrastructure and technology in the production of crops without soil (soil-less culture) will be covered. The course will emphasize the production of high value short term fruit, vegetable and ornamental crops without soil.

References

Benton Jones, J. 2005. Hydroponics: a practical guide for the soilless grower. 2nd ed. Boca Raton, CRC Press. Ho, B. L.

Kenyon, S. 1982. Hydroponics for the home gardener (Rev.ed.). Van Nostrand Reinhold Ontario, Canada.

RC30303 SEED TECHNOLOGY

Seed development after fertilisation, seed structures and dispersal are taught. The physiology of seed germination, viability tests and seedling vigour are highlighted. Categories of seeds for human consumption, livestock feeds and as planting materials. Seed production, collection, cleaning, processing, and storage (of orthodox and recalcitrant seeds) and cryo-preservation are included. Seed testing laboratories and protocol for seed purity and standards set by A.O.S.A. are included. Controlled pollination in the production of breeder seeds is also taught. Seed certification for commercial seed producers and the network in seed trade are integral parts of the course.

RC31302 MANAGEMENT OF SMALL AND MEDIUM INDUSTRIES

This course focuses on how entrepreneurs of small and medium size enterprises (SMEs) perceive the processes associated with strategic management, what decisions and actions they adopt to ensure competitive advantage, how business strategies are formulated and implemented in SMEs, and the strategic role of entrepreneurship within small businesses. The course also discusses how SMEs should operate for maximum competitive advantage, and consider the gap between ideal theory and practice. Policy issues and challenges facing the SMEs in Malaysia also covered in this course. By the end of the course students should be able to understand most of the strategic management process of SMEs.

RC31402 WATER RESOURCE MANAGEMENT

This course provides a broad overview on water resources, quantity, quality, uses and management in relation to agriculture. The hydrologic cycle, biophysical principles and the effects of changing climate / environment factors on water resources and sustainable practices in use of water resources for agriculture will be stressed. Current issues regarding water use in agriculture will be discussed.

RC31502 PLANT SYSTEMATICS

This course introduces students to traditional taxonomy, the description, identification, nomenclature, and classification of plants. They will be guided to understand the reconstruction of phylogeny, or evolutionary history, of plant life. The course is divided into four parts: introduction to systematic, evolution and diversity of plants, systematic evidence and descriptive terminology, and resources in plant systematic. Emphasis is given on the application of systematic approach to identify and select plants, from the pool of genetically related agricultural and horticultural plants, or hybrids, for further trait and quality enhancement.

RC31602 INTRODUCTION TO AQUA-AGRI ENTREPRENEURSHIP

The course introduces students to the value chain of aqua-agri entrepreneurship. Topics taught entail importance of distinguishing the high impact projects in aqua-agriculture, stimulators for aqua-agri entrepreneurship development, critically linkages between various organization/stakeholders in the chain, profiling of aqua-agri business chains, selected market channels and inter-sectoral networks in the pipeline of entrepreneurship. Students will experience to use value chain analysis as a method to understand aqua-agri pipelines from a holistic view. This course will also expose students to identify opportunities in aqua-agri entrepreneurship.

RC31102 HERB AND SPICE CROPS

This course emphasizes to the herb and spice crops in propagation, cultivation management in farm, harvest, postharvest handling and processing aspects. The estimate cost of production and income of the herb and spice crops along with their importance in agricultural sector in our country will be discussed.

LIVESTOCK PRODUCTION PROGRAMME (HG36)

RL10303 INTRODUCTION TO LIVESTOCK PRODUCTION

This course discusses the scope of the livestock industry, career opportunities in animal sciences, principles of breeding, physiology and nutrition in relation to production, latest technologies in animal production with emphasis on recent livestock production systems, focusing on ways to increase productivity to provide affordable and sufficient livestock products. It also covers topics on processing and marketing of animal products.

RL10404 ANIMAL ANATOMY AND PHYSIOLOGY

This course covers animal anatomy and physiology. Various systems such as the skeletal, muscular, respiratory, circulatory, nervous, endocrines, urinary and digestive systems will be discussed. The course includes the basic principles of physiology, preservation of tissues/ organs and will use tools such as anatomical models and preserved specimens.

RL20103 ANIMAL BREEDING

This course introduces students the principles of animal breeding and basic concepts in animal genetics. It covers topics on genetics and statistical basis of animal improvement, selection of breeding program, and transmission of characteristics. The genetic improvements of livestock by means of breeding systems, selection methods and performance testing will be discussed.

RL20403 ANIMAL BEHAVIOUR AND WELFARE

This course will introduce students to various concepts of animal behaviour and welfare with emphasis on the farm animals. It will cover concepts underlying behaviour, their causes, and implications on management, health, production, and welfare. It will include topics on development of behaviour, social behaviour, mating systems and reproduction, biological rhythms, human-animal interactions, animal handling and atypical behaviour.

RL20603 ANIMAL NUTRITION

This course will introduce students the importance of nutrition in farm animal, principles of nutrition in getting maximum output from farm animals. The common feed being used in the industry in feeding ruminants and monogastrics will be introduced. The topics will highlight the importance of each nutrient in animal feed and their digestion and metabolism. This course will also discuss the basic sciences and principles in evaluation of animal feedstuff, especially during practical session and relate it to the livestock industry of the country.

RL20803 PASTURE AND FODDER MANAGEMENT

This course introduces the production of forages including grasses, leguminous and non-leguminous plants and fodder as ruminant feed. Commonly sown forages and legumes in the country will be introduced while the establishment, growth, harvest, maintenance, renovation and succession will be described during lecture and practical session. The establishment of forages under cut-and-carry fodder system and pasture grazing system, as well as integration will be discussed. The relationship between pasture and fodder production with animal production system will be detailed. Exposure to the quality of forages as affected by various

factors will be given. The conservation of excess forages or the maintaining of the quality of forages will also be included. Finally, the methods and analyses in determining the quality of forages will also be a part of this course.

RL21203 POULTRY PRODUCTION

This course covers all aspects of poultry husbandry practices including breeding, nutrition, management, housing, equipment, health and welfare. Emphasis will be on broiler and layer production.

References

RL30303 MONOGASTRIC LIVESTOCK PRODUCTION

This course covers all aspects of swine husbandry practices including breeding, nutrition, management, housing, equipment, health and welfare. Emphasis will be on breeds, selection and judging, housing and equipment and marketing of swine. The course will also give some introduction to other monogastric farm animals such as horses and rabbit production.

RL30403 BEEF AND DAIRY PRODUCTION

This course includes important aspects of dairy and beef cattle management from birth to adult, various breeds of dairy and beef cattle, selection and judging dairy and beef cattle. It will include breeding, nutrition and management, milking management, dairy herd health, dairy housing & equipment, marketing of milk, beef cattle health management, beef cattle housing and equipment and

marketing of beef.

RL30503 LIVESTOCK FEED PROCESSING

This course will introduce students the feed industry and the production of livestock feed in the country so that it can be efficiently used by the ruminant and monogastric animals. Conventional and non-conventional feed resources will be shared and the processing of these resources into useful animal feed will be explained. The various methods, equipment, machinery as well as technology in producing, processing and even preservation of feed will be discussed with the students. Last but not least, students will be exposed to the methods of handling, HACCP and certification of processed and quality feed.

RL30603 ANIMAL DISEASES AND HEALTH CARE

This course deals with common diseases (infectious and non-infectious) of livestock, aetiology, symptoms, effect on animal production, treatment and prevention. It will include topics such as proper handling and care of animals, hygiene, sanitation, vaccination schedule, immunization, and health monitoring.

RL31103 SMALL RUMINANT PRODUCTION

This course covers all aspects of small ruminant (sheep, goats and deer) husbandry practices, including breeding, nutrition, management, housing, equipment, health and welfare. Various breeds of sheep, goats and deer will be discussed. Emphasis will be given to ways of increasing the production of milk, meat and wool and the marketing of the products.

RL40103 HANDLING AND PROCESSING LIVESTOCK PRODUCTS

This course will introduce students to the understanding of the ante- and post-mortem effects on livestock products quality. The topics include products collection, preservation, processing, marketing and safety, carcass evaluation, meat hygiene, meat selection, identification of standard cuts, meat curing and other meat preservation methods, meat structure and water holding capacity of meats. Post-harvest decontamination techniques such as chemical dehairing, hot water rinse, steam pasteurization, steam vacuum, chemical rinsing, and lactoferrin and combined treatments—"Hurdle Technology" will be discussed. This course covers livestock by-products processing and utilization. The contents cover both edible and non-edible products of poultry and livestock. Medical and pharmaceutical processing and utilization, processing of leather, meat balls, woolens, slated eggs, animal feeds and others will be discussed.

RL40703 LIVESTOCK WASTE MANAGEMENT

This course covers various systems of collection, storage, treatment, transport and utilization of livestock and other agricultural organic wastes and wastewaters. Types of anaerobic digesters, gas utilization options, safety and management of digester and gas utilization equipment are discussed. The course will also discuss the physical, chemical and biological properties of livestock wastes, their impacts on the environment and measures to minimize the impact on the environment.

ELECTIVE COURSES

RL30402 LIVESTOCK SELECTION AND EVALUATION

The course will introduce students the principles and concepts of selection and evaluation of animals. It will include the various method of selection and evaluation which being practiced in the livestock production. The course will include identification of physical characteristics of different types of livestock.

References

RL30702 ANIMAL ENVIRONMENTAL PHYSIOLOGY

The course aims to study the effects of the environment on the physiology of mammals with emphasis on stress, behaviour, water and electrolyte balance and other adaptations to environmental variations. Attention will be placed on the problems associated with the improvement of livestock production in tropical climates. This course aims to develop an understanding of the environmental needs of animals including climate, social stress and shelter requirements and it should enable students to appreciate the use of animal behaviour as a measure of stress and welfare.

RL30902 ALTERNATIVE ANIMALS

This course will cover the various aspects of production of alternative animals such as rabbits, ostriches and ducks. It will focus on husbandry practices including breeding, nutrition, management, housing, equipment, health and welfare of alternative animals. Visit to local farms and analyzing farmer's problems will also be a part of the course.

RL31002 ANIMAL BIOTECHNOLOGY

The course will introduce students the concepts of biotechnology specifically on assisted reproductive technologies used in livestock production. It will include artificial insemination; estrous synchronization; superovulation; *in vitro* fertilization; embryo transfer; sexing of embryos and other manipulations of embryos. The topics on genetic engineering and cloning will also be discussed.

RC30103 FARM MECHANIZATION

This course introduces the principles behind the design and operation of common types of farm machinery and mechanisms; familiarizes students with agricultural mechanisation policy and strategy and its implications on agricultural development; teaches students financial costing and accounting of agricultural machinery and analyses factors that affect economic operation for effective management decisions.
